

# THE RAD RAMP

## Less Radiation and Greater Safety

### The RAD Ramp

**The RAD Ramp provides a 2 in 1 option for raising contralateral leg during surgery and postop X-rays**

- Allows OR and Radiology staff to position for a better view while standing outside the field of radiation.
- The RAD Ramp elevates the operative leg above the contralateral leg for clearer images with less radiation.
- Position leg on the RAD Ramp, secure the ankle or foot for accurate placement, and drop the X-ray cassette in the side pocket to maintain a steady upright image

**NEW**

Convenient for OR postop and PACU X-rays

*The RAD Ramp is a portable positioning device that can be used in the OR and the PACU to allow better lower extremity elevation and stability for better X-ray views.*
